```
let employeeArr = [3, 4, 5, 6, 7];
let employeeBonusArr = employeeArr.map((value, key) => {
    if (value == 5) {
       return value * 4;
    } else { mackliu, 10 分鐘前 • filter
       return value * 2;
    }
});
console.log(employeeBonusArr);
```

map()映對二維array有值有key時使用免用FOREACH等迴圈執行

```
let i = 0;
let sum = employeeBonusArr.reduce((total, value) => {
    i++;
    console.log('i', i);
    console.log('total', total);
    console.log('value', value);
    return total + value;
});
console.log('sum', sum);
```

reduce()對每一個元素都帶入執行如上:先帶入一元素值total然後再帶入第二元素value然後將其加總,全部元素都帶入執行完畢後回傳執行結果

```
// filter 塞選資料
let employeeArrFilter = employeeArr.filter((value) => {
    return value < 5;
})
// 工程師不會通靈
console.log('employeeArr', employeeArr);
console.log('employeeArrFilter', employeeArrFilter);
```

filter()篩選函式,在arry中對value之條件指定的規則篩選符合者 回傳陣列如上回傳符合value<5的陣列值
